The current list of properties for my Milestone 1 Low and High Fidelity Render include:

- Windows Media Player, for media playback during the personal shopping experience. This features a list-box for holding the string name of the file to be loaded for the user's personal media files for playback.
- Group-box and Text-box for "chat support" system, when shopping inside the application. This will utilize a multi-facet of string, int, and maybe attachments as well to be sent through the testing phase messaging service.
- Date, this is in place to inform the current user of the current date. This will feature the int and string information for the user to glance at in the top right corner.
- Tab Control, this is going to be the foundation of the store as well as being able to utilize strings for the items, along with int, doubles, and additional button and format layouts.
- There will be the implementation of user's picture as well as displaying the string element of the user's first name before gaining access to the system at large.
- Moving forward I would also like to implement a login, as well as a logout form for the complete shopping experience to be as ideal as possible. This will also utilize media, strings and int's for passwords, along with some additional security measures and graphical visuals.
